DETAILED ACTION

EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Bryant R. Gold on 6/6/06.

The application has been amended as follows:

In claim 28, line 2, replace "whose" with –using—. line 2, delete "are well described".

In claim 38, line 2, replace "whose" with –using—. line 2, delete "are well described".

Allowable Subject Matter

Claims 20-39 are allowed.

The following is an examiner's statement of reasons for allowance:

Applying electrical stimuli to groups of electrodes and monitoring stapedial reflexes for temporal and spatial integration to control the intensity of electrical stimuli following the integration as claimed is not taught nor suggested by the prior art of record. Further, applying electrical stimuli to three or more adjacent electrode contacts and using the stapedial reflexes from the stimuli to control the intensity of additional electrical stimuli to the electrode contacts does not appear to be an obvious extrapolation of single channel stapedial reflex monitoring because multi-channel stimuli

Art Unit: 3762

create spatial resolution difficulties that do not appear intuitive to resolve for an associated stapedial reflex.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Faltys et al '861 teach single channel monitoring of stapedial reflexes. There lacks a teaching or suggestion to monitor the stapedial reflexes for spatial integration based on a group of electrical stimuli.

Faltys et al '580 teach multi-channel stimulation; however, combining the stimulation with stapedial reflexes is not disclosed nor an obvious modification to combine.

Carter et al '360 disclose a multi-electrode intracochlear array and sensing electrical activity of the stapesius muscle. However, the stapedius signals are processed based on a predetermined algorithm to define a maximum comfortable stimulation level and do not appear to be capable of being used to alter post array stimuli based on temporal and spatial integration responses, or the stimuli of three or more adjacent electrodes, of previous array stimuli.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to George Manuel whose telephone number is (571) 272-4952.
